

Connecting Liverpool and Cecil Park reservoirs

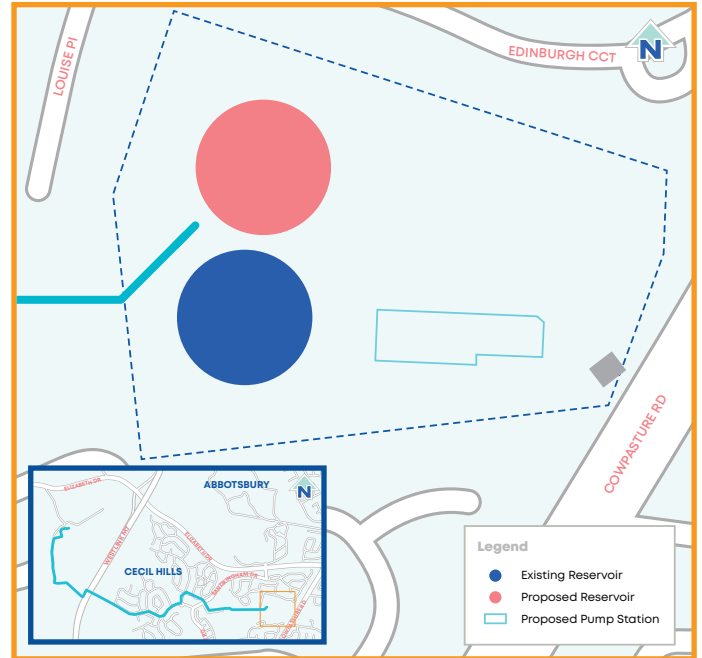

What we're planning to do in Liverpool and Cecil Park

We're planning to upgrade existing drinking water infrastructure at the Liverpool and Cecil Park reservoir sites. A new reservoir tank and water pumping station will be added to the site at Liverpool, with a new pipeline connecting the two reservoirs. These upgrades will provide resilience to the local community by allowing water to be sourced from either of the supply networks.

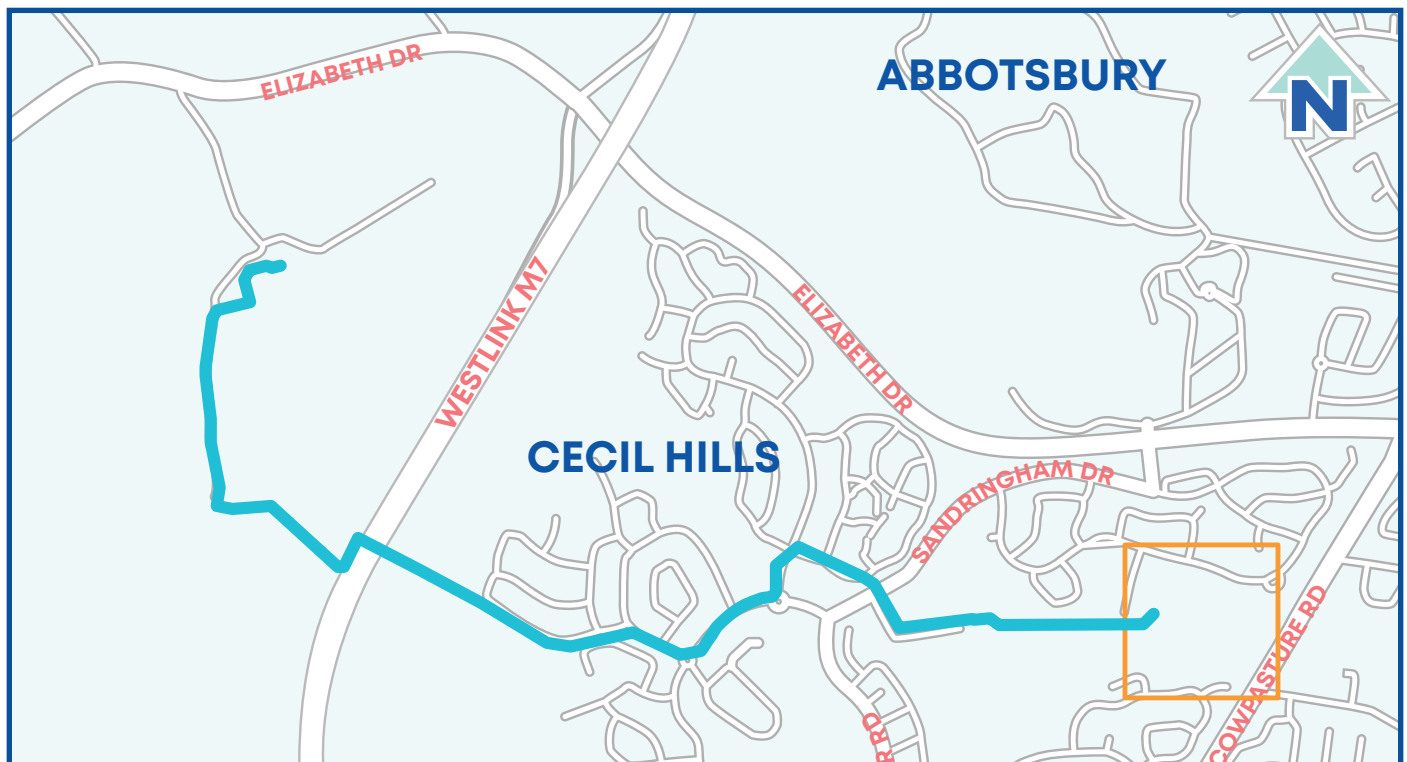

The proposed route of the pipeline between Liverpool and Cecil Park follows existing roads and public reserve land. To help in the development of our designs, we're completing geotechnical and survey site investigations in the area. Some private landowners will be contacted to allow us to investigate existing stormwater drains and sewer maintenance holes on their property to allow our design to accommodate these existing services.

Project Status and Milestones

We've started constructing the new Liverpool reservoir with our contractors preparing the site for the new water tank. We're finishing the design of the underground pipeline in discussion with the needs of Liverpool City Council, Western Sydney Parklands, Westlink M7 and Transport for NSW. Construction of the pipeline is expected to start in July 2020.
